

Software for HITH / PITH

eCase provides an unique software solution for providers of Hospital in the Home, allowing focus on providing quality services whilst enabling better health outcomes for clients.

Software features include:

Clinical Care

Comprehensive clinical tools including charts, assessments, careplans and trigger-based tasks lists. Fully configurable suite of assessment tools (eg. palliative pathways, IV therapy, allied health).

Workflows and Decision Support

The eCase Electronic Care Canvas™ provides configurable trigger-based workflows and alerts for all diagnosis and clinical pathways. Escalation and workflows generated from clinical anomalies and variances.

FHIR and HL7

FHIR is the evolution of HL7. Health Metrics draws in data from disparate environments outside Health and Social Care such as the acute sector, allied health and others. All this data, whether it's FHIR or otherwise will use the eCoWare platform for interoperability (translation, conversion, management et al).

Wound Management

Comprehensive management for complex wound care including wound management (eg. VAC therapy), photos, wound details, procurement of wound supplies with costings. Telehealth functionality to allow for specialist consultations.

Pathology and Radiology Results

All system "objects" can be stored in a common repository. The common repository can hold any object, be it an X-ray or a pathology report/pdf. It can be absorbed via eCoWare and browser rendered. There are no practical constraints other than the limitations of things like DiCom readers run through browser environments.

Medication Management

ePrescribing, phone orders with DocuSign capability. Full bidirectional integration with commercial packing systems, cosign ability for S8, S4 and IV therapy as required.

Compliance Reporting and MyHealth record

Comprehensive reporting capabilities to meet all funding and legislative requirements. Integration with B2B portals for data transfer as required. Cost reporting and analytics.

Health Metrics currently integrates with the MyHealth record.

Secure Messaging + FHIR

Secure messaging in eCase is supported via the Message Board function. This is secure to the extent that the messages are secure in transit and they are encrypted at rest. Further, using our eCoWare interoperable platform (eCase DNA), eCase can intercept messages and conform to protocols such as FHIR and/or traditional HL7 for the consumption and delivery of messages conforming to CDA standards.
